

For its cases, GIVI guarantees a degree of water resistance equivalent to a heavy rain. In particular, cases are tested with a special machine that simulates rain with a flow rate of 20 ltr/min, that is the normative condition that simulates vertical and lateral rain. The test examines the case and verifies that it is protected against water spray from all directions.

The maximum tolerance within which a GIVI case can be considered compliant with the regulation is 10cc. However, under certain conditions of use, water may penetrate inside the case. Examples of possible water penetration are: the crossing of large puddles (especially for side-cases), or very powerful water sprays, such as washing with a pressure lance.

With regard to the care of your case, GIVI strongly advises against the use of pressure lances. The company also recommends washing cases separately, after removing them from the motorcycle.

In order to have an optimal level of waterproofing, GIVI offers in its catalogue a series of inner bags, to be purchased separately, which also allow you to comfortably transport your inner luggage without having to detach the cases from the motorcycle.
